Abstract : IHO Stakeholders' Open Session HSSC-13, May 2021

Vision of onboard use of S-100 based products

e-Navigation, as IMO calls it, is coming. This challenge both providers of onboard equipment, information providers and training institutions. The presenter has been observing navigation from the very early days of computerized means – actually when the first devices loaded software from a punched paper tape. The e-Navigation could be based on separate digital material replacing existing separate printed material. But the benefits of doing so are quite limited. This presentation is a vision about what could be achievable in the future when all available information is combined and integrated into a seamless system.
