

Proposed Timeline

13-14 Feb	Generate mature draft
1 Mar	Circulate initial draft to MS and stakeholders for comment
14-30 Apr	Prepare draft GD for submission to IRCC9
1 Jul	IRCC formally circulate draft for MS comment
Late 2017/early 18	CSBWG5 meeting, consider external input and comments
Apr/May	Prepare Edition 1.0.0 for submission to IRCC10
Sep	Formal submission to IHO Council2
Oct	IHO Council2 approval
1 Jan 2019	CSBGD Edition 1.0.0 released
Late 2018/early 19	CSBWG6 meeting, commence work on Edition 2.0.0

Crowdsourced Bathymetry Data Pipeline Infrastructure Update

Jennifer Jencks & Adam Reed

Feb 13, 2017

CSBWG4

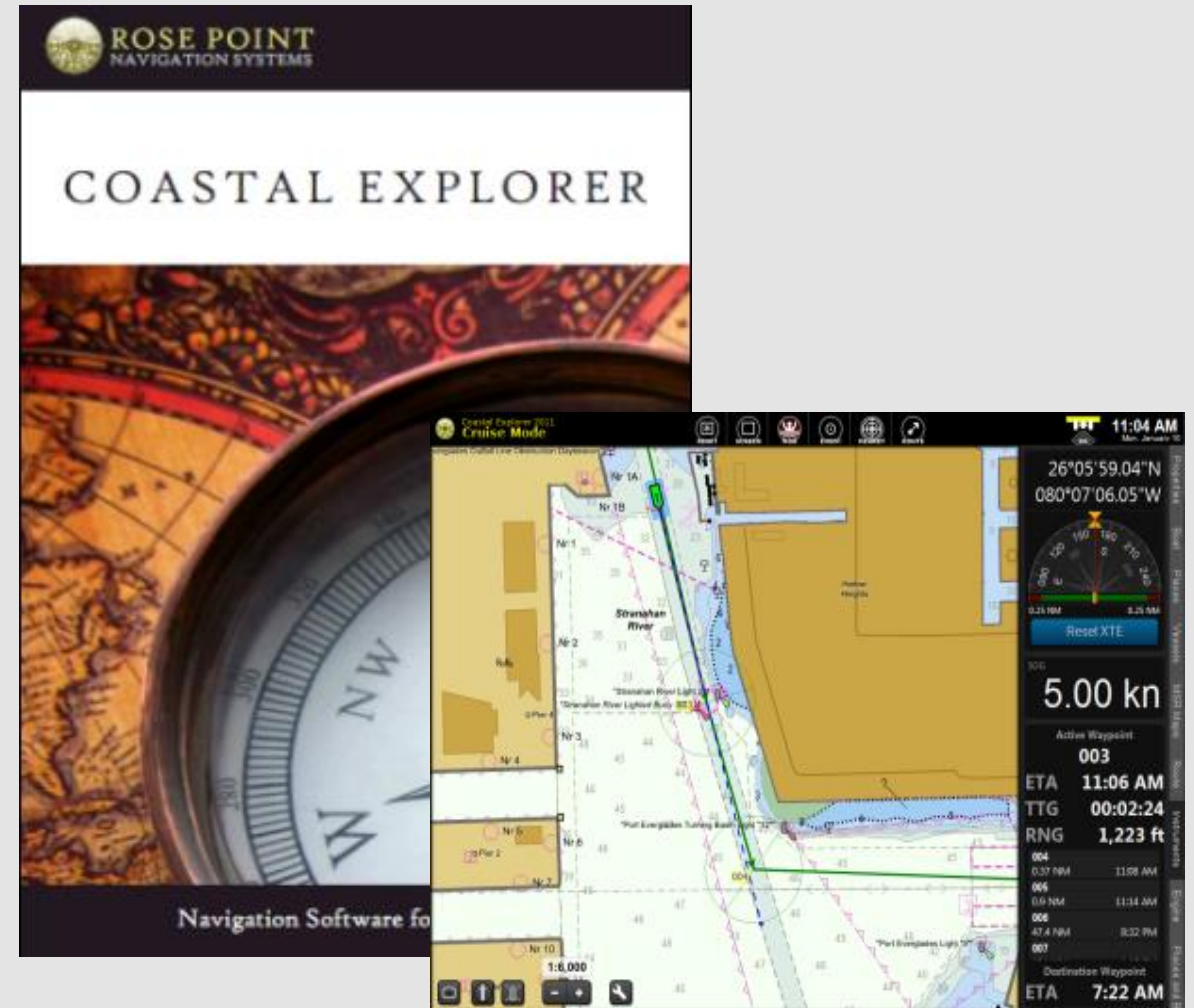

Objective

To enhance the IHO DCDB infrastructure and interface to ultimately allow the public to ***upload, discover, display and download*** CSB data via a web-based interface.

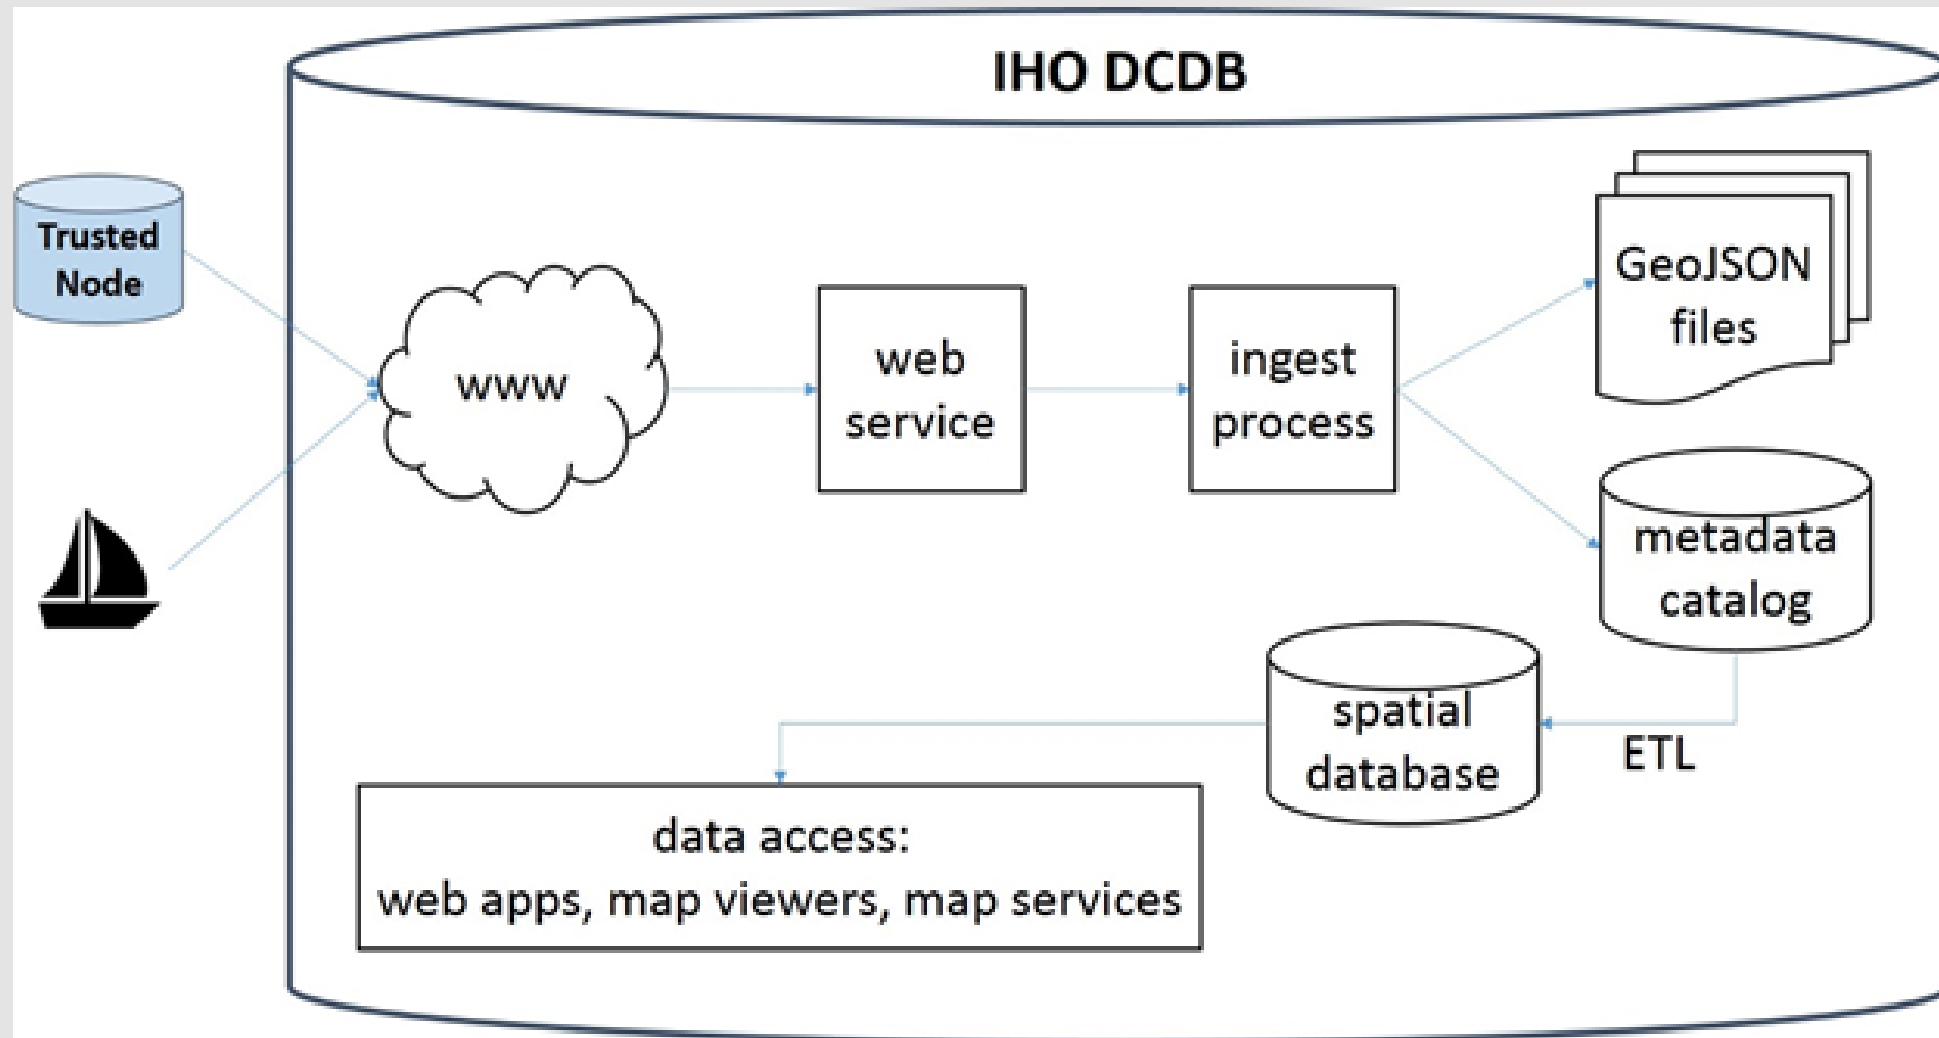

Rose Point Pilot Project

- NOAA and the DCDB have teamed with Rose Point Navigation Systems
- Mariners are given an option to enable CSB logging allowing a modified electronic charting system log file to record position, depth and time.
- Mariners can choose to be anonymous or to submit metadata about vessel and equipment
- A modified log file gets submitted via HTTP post that contains a JSON metadata string

Project Flow

Jan - Mar 2017: Dedicated software developers

- Harden the current data ingest system
- Automatically load CSB data streams into new CSB spatial database and archive
- Improve display and discovery of IHO CSB data via map viewer
- Enable delivery of CSB data to the public
- Identify a point storage technology we can dynamically generate point data results

Map Display

Line Generalization:

- To accommodate millions of points in a trackline, the team implemented a line generalization algorithm that generates the trackline for the map but loads far less points into the database.
- This fixed memory errors that were limiting the loading of data.

Map Display

Segmentation of lines

- To eliminate two points (that should not be connected) from being connected the concept of multiple separate lines being generated and stored was implemented.
- This scenario could occur when a ship recording data turned off it's recorder for an extended length of time and then turned it back on.
- To filter out bad points determined (and will apply) variables for line segmentation

Enable delivery of CSB data

Enable basic delivery of data that will contain full GeoJSON files or other submission format (XYZT)

- Filter criteria passed from CSB viewer to data delivery system: data extract by platform and sensor, date/time, data provider (trusted node), etc
- System packages whole, original files
- Include metadata with data download packages, i.e., with everything included in the [GeoJSON](#).
- Errors (archive extract, packaging issue, etc.) reported to user and data manager

Working on this week

- Break line segments - finishing touches
- Prepend date to processed filenames
- Generate tracklines from files that do not contain time (based on order of files)
- Harden delivery system

Next up

- INGEST: Enable ability to add new Trusted Nodes to the ingest pipeline without the need for software programmer time.
- DELIVERY: Have portions of a file delivered to get only the data a user wants (e.g., draw a box around data I want and get only the portion of the file within the box).
- DISPLAY: Identify a point storage technology we can dynamically generate point data results
 - CSB would then be displayed as tracklines or points

Next Year

- INGEST: Scale up number of contributors/trusted nodes
- DELIVERY: Enable option for user to choose delivery format(s)
- DISPLAY: Enhance point data display (ie: Heat maps?)
- TBD...

Thank you
